

AGENTIC COMPUTING APPRENTICESHIP

60-minute challenge brief • Lesson 03

Student Data-to-Site Challenge

The challenge

Design and build a useful OpenAI Site based on data your team collects or obtains from reliable public sources. Your Site must help a business, government agency, nonprofit, or community group understand a problem and make a decision.

Here is one I built <https://energy-atlas-jw-0916.johntango.chatgpt.site/>

First follow along in class.

- 1) Create a directory to store the data and where you will create a website
- 2) Copy the data from here [Data on Energy Costs](#) to your directory
- 3) Create a Codex Project and link it [energy-data.csv](#) to your directory
- 4) Follow along

Challenge areas- Now build your own (60 mins)

Choose one of the challenge areas below—or propose a similar area with your instructor's approval

1. **Local business location**

Help a business choose the best location for a new shop, restaurant, clinic, or service. Compare factors such as population, competitors, rent, foot traffic, income, parking, and public transport.

2. **Community energy dashboard**

Help a city or business understand energy costs and sources. Compare consumption, prices, solar and wind production, emissions, imports, and opportunities to reduce costs.

3. **Small-business market opportunity**

Identify an unmet customer need or promising product category. Collect survey data and examine prices, customer preferences, competitors, demand, and purchasing habits.

4. **Tourism planning**

Help a tourism organization attract visitors while managing local impacts. Compare visitor numbers, seasonal demand, attractions, accommodation, spending, transport, and resident feedback.

5. **School facilities and student experience**

Help school leaders improve facilities or services. Collect anonymous data about study spaces, food services, technology, transport, extracurricular activities, or student wellbeing.

Site requirements

Your Site should include:

- A clear statement of the problem and intended user
- An explanation of how the data was collected
- At least three useful charts, maps, tables, or indicators
- Filters or comparison controls that let users explore the data
- A summary of the most important findings
- Two or more practical recommendations supported by the data
- Sources, dates, units, and definitions
- A discussion of missing data, bias, uncertainty, and limitations
- A design that works on both computers and phones

Do not collect names, contact details, medical information, precise personal locations, or other sensitive data.

Deliverables

Each team will submit:

1. The published Site
2. The collected dataset in CSV or spreadsheet format
3. A one-page data and methodology note
4. A five-minute presentation demonstrating the Site
5. A short reflection explaining what the data supports—and what it cannot prove

Suggested assessment criteria

Area	Weight
Purpose and usefulness	20%
Data quality and documentation	20%
Analysis and reasoning	20%
Site functionality and usability	20%
Visual communication	10%
Recommendations and limitations	10%

The strongest projects will turn collected data into a clear decision-making tool rather than simply presenting a collection of charts.

Add a login option so you can track users.

SUBMISSION

Submit the URL of your site

Example of Codex working on AWS

I'll create the dedicated website bucket and CloudFront distribution in your confirmed AWS account, leaving the existing media bucket unchanged. I'll check the proposed resources before applying them.

 Read files, ran commands

The reviewed change set contains only seven new hosting resources—no changes to existing infrastructure. AWS has started creating them; CloudFront can take a few minutes to finish.
