EVIDENCE TABLE

Detailed comparison

Sort by Electricity price Download CSV

MARKET	PRICE	CONSUMPTION	NON-FOSSIL	BALANCE / TRADE	PERIOD
Denmark	0.355 USD/kWh	0.7 EJ	86.4 %	+0.3 EJ	2023-2026 average 2023
Switzerland	0.367 USD/kWh	1.1 EJ	98.0 %	+0.7 EJ	2023-2026 average 2023
Germany	0.406 USD/kWh	11.4 EJ	56.1 %	+8.2 EJ	2023-2026 average 2023
Belgium	0.406 USD/kWh	2.3 EJ	73.5 %	+1.9 EJ	2023-2026 average 2023
Italy	0.414 USD/kWh	6.1 EJ	44.6 %	+5.2 EJ	2023-2026 average 2023

Cost x Mix and Electricity mix

Median lines frame the price and non-fossil screen. The normalized stacked bars preserve composition and end at 100 percent.

Balance, Evidence table, and CSV

Periods, fallback flags, and stable machine fields carry the visual comparison into the downloadable record.

Fixed story views and dynamic Signals

GUIDED ANALYSIS

Four views that start with a decision question

Each view applies a fixed, reproducible configuration. The Atlas evidence comes from this snapshot; the linked sources provide market context.

01

Active

Europe's price high point

ATLAS EVIDENCE

Italy records the highest household and business prices in Expanded 50 at 0.414 and 0.411 USD/kWh. Germany and Belgium both record 0.406 USD/kWh for households.

MARKET CONTEXT

The pattern may reflect differences in wholesale costs, taxes, levies, and network charges. The linked IEA and Eurostat material explains why a retail price needs a component-level review.

Management meaning: Treat the price ranking as a prompt to request the applicable industrial tariff, demand charges, and contract terms before comparing sites.

IEA Italy 2023 Eurostat electricity price data

View active

02

Ethiopia's price and structure contrast

ATLAS EVIDENCE

Ethiopia combines the lowest household price, 0.006 USD/kWh, with 100.0% non-fossil generation and 96.4% hydro. Algeria records 0.9% non-fossil generation in the same comparison.

MARKET CONTEXT

The contrast may reflect very different power systems, access conditions, and tariff structures. The World Bank compact provides context for Ethiopia's expansion priorities and financing needs.

Management meaning: Low national price and a high non-fossil share do not settle site viability. Ask about connection capacity, reliability, customer class, and supply terms.

World Bank Ethiopia National Energy Compact

Open this view

03

Consumption scale in China and the United States

ATLAS EVIDENCE

China accounts for 31.1% and the United States 17.3% of the 545.0 EJ reported total. Together they represent 48.4%; the five largest markets represent 64.6%.

MARKET CONTEXT

This concentration may reflect industrial scale, population, and energy demand across sectors. IEA Electricity 2025 supplies current context for China's power demand and supply outlook.

Management meaning: A country count can hide portfolio concentration. Test recommendations with and without the two largest markets.

IEA Electricity 2025

Open this view

04

Diverging energy balance positions

ATLAS EVIDENCE

The screening proxy is positive for China (35.5 EJ) and India (16.2 EJ), and negative for Russia (-31.0 EJ) and the United States (-14.0 EJ). Positive means consumption exceeds production in this cross-source calculation.

MARKET CONTEXT

The split may reflect domestic production, demand, and accounting differences. EIA material on the United States and Russia helps interpret the national positions without relabeling the proxy as observed trade.

Management meaning: Use the balance gap to prioritize diligence on verified trade flows, fuel exposure, and local reliability, not as a final import measure.

DYNAMIC SIGNALS

What the selection says

Descriptive evidence updates with every control. Each card states the result, its decision meaning, and the next local input.

CURRENT METRIC

DATA USED: 5 OF 5 MARKETS IN THE CURRENT SCOPE REPORT HOUSEHOLD PRICE DATA (100%).

Selected prices versus the active dataset

Evidence: the selected median is 0.406 USD/kWh versus 0.165 for this dataset, a 146.1% difference. Meaning: the current scope changes the cost screen. Verify the customer class and site tariff.

Next diligence: verify current local tariffs, capacity, reliability, and contract terms.

COST AND STRUCTURE

DATA USED: 5 OF 5 MARKETS REPORT BOTH PRICE AND NON-FOSSIL DATA (100%).

Cost and mix diligence shortlist

Evidence: 0 selected markets meet the dataset medians of ≤ 0.165 USD/kWh and $\geq 42.9\%$ non-fossil: none. Price and mix association is very strong ($r=-0.86$, $n=5$). Meaning: these thresholds define an entry list for diligence; compare current site terms before sequencing markets.

Next diligence: verify current local tariffs, capacity, reliability, and contract terms.

CONCENTRATION

DATA USED: 5 OF 5 MARKETS REPORT PRIMARY-ENERGY CONSUMPTION (100%).

Largest-market concentration

Evidence: Germany represents 52.8% of selected consumption across 5 markets. Meaning: country counts can understate portfolio exposure. Re-run the decision without the largest market.

Next diligence: verify current local tariffs, capacity, reliability, and contract terms.

CONFIDENCE

DATA USED: 5 OF 5 MARKETS REPORT ELECTRICITY PRICE DATA (100%).

Strong coverage

Evidence: 5/5 values are reported (100%), with 0 fallbacks, 0 missing values, 1 periods, and 0 overlapping regional memberships. Meaning: retain these qualifiers in any decision memo.

Next diligence: verify current local tariffs, capacity, reliability, and contract terms.
